

Class: SE Comp **Experiment No: 6**

**Ashish Jha**

**Roll No. 27**

**Batch : B**

<b>Topic:</b>	Implement SQL Functions (string case and manipulation operations, Numeric, Date & Time functions), Group By, Having Clause and Order By clause.
<b>Prerequisite :</b>	Knowledge of SQL syntax.
<b>Mapping With COs:</b>	CSL402.2, CSL402.3
<b>Objective:</b>	<ul style="list-style-type: none"><li>- To explore and implement single-row functions and Aggregate functions available in SQL.</li><li>- To apply various functions within the query statement.</li><li>- Practice Queries using Single-row functions, Aggregate functions (COUNT, SUM, AVG, MAX and MIN)</li><li>- Apply ORDER BY, GROUP BY, and HAVING clauses.</li></ul>
<b>Outcome:</b>	<p>After completion of this lab, the student should be able to:</p> <ul style="list-style-type: none"><li>- Implement Single row functions in SQL statements</li><li>- Implement Aggregate functions in SQL statements</li><li>- Implement Order by, Group by and Having clause in SQL statements - Explain and use SQL functions to manipulate dates, strings, and other data.</li><li>- Describe various types of functions available in SQL</li><li>- Use character, number, and date functions in SELECT statements - Describe the use of conversion functions</li></ul>
<b>Instructions:</b>	<ol style="list-style-type: none"><li>1. This experiment is a compulsory experiment. All the students are required to perform this experiment individually.</li><li>2. Implement all the types of single row and multiple row functions. Implement Order by, Group By and having clauses. Also implement Nested Grouping and nested aggregate functions.</li></ol>

<b>Deliverables:</b>	<p><b>1. COUNT FUNCTION</b></p> <ul style="list-style-type: none"> <li>- <b>COUNT function is used to Count the number of rows in a database table. It can work on both numeric and non-numeric data types.</b></li> <li>- <b>COUNT function uses the COUNT(*) that returns the count of all the rows in a specified table. COUNT(*) considers duplicate and Null.</b></li> </ul> <p><b>2. SUM Function</b></p> <ul style="list-style-type: none"> <li>- <b>Sum function is used to calculate the sum of all selected columns. It works on numeric fields only.</b></li> </ul> <p><b>3. AVG function</b></p> <ul style="list-style-type: none"> <li>- <b>The AVG function is used to calculate the average value of the numeric type. AVG function returns the average of all non-Null values.</b></li> </ul> <p><b>4. MAX Function</b></p> <ul style="list-style-type: none"> <li>- <b>MAX function is used to find the maximum value of a certain column. This function determines the largest value of all selected values of a column.</b></li> </ul> <p><b>5. MIN Function</b></p> <ul style="list-style-type: none"> <li>- <b>MIN function is used to find the minimum value of a certain column. This function determines the smallest value of all selected values of a column.</b></li> </ul> <pre> use mysql CREATE TABLE students(st_id int primary key, st_name varchar(100), st_ph_no varchar(100),branch varchar(5));  CREATE TABLE marks(mr_id int, mark int, foreign key(mr_id) references students(st_id));  insert into students values(11,'AAA','111...','comps'); insert into students values(12,'BBB','222...','it'); insert into students values(13,'CCC','333...','comps'); insert into students values(14,'DDD','444...','it');  insert into marks values(11,80); insert into marks values(12,50); insert into marks values(13,70); insert into marks values(14,90);  desc table students;  desc table marks;  select * from students; select * from marks; </pre>
----------------------	--

```

select min(mark) from marks;

select max(mark) from marks;

select avg(mark) from marks;

select count(mark) from marks;

select count(st_id) from students;
where st_id > 102;

select *from marks
order by mark;

select branch from students
group by branch;

drop table students;
drop table marks;

```

### Output :

Result Grid												
Filter Rows:												
	id	select_type	table	partitions	type	possible_keys	key	key_len	ref	rows	filtered	Extra
▶	1	SIMPLE	students	NULL	ALL	NULL	NULL	NULL	NULL	1	100.00	NULL

Result Grid				
Filter Rows:				
	st_id	st_name	st_ph_no	branch

### Department of Computer Engineering

#### Assessment Rubric for Experiment No. 6

**Title of Experiment :** Implement SQL Functions, Group By, havin and order by clause

**Performance Date :**

**Year and Semester :** 2nd Year and IV<sup>th</sup> Semester **Submission Date : Name: Batch : Roll No. :**

	Criteria	1 Marks	2 Marks	3 Marks 4 Marks	5 Marks
1	Execution	Executed 10-30% queries based on following:  - All single row functions  - All Aggregate functions Nested Aggregate functions - Order by - Group by - Having clause - Nested Grouping	Executed 31-50% queries based on following:  - All single row functions  - All Aggregate functions Nested Aggregate functions - Order by - Group by - Having clause - Nested Grouping	Executed  Executed 51-70% queries based on following:  - All single row functions  - All Aggregate functions Nested Aggregate functions - Order by - Group by - Having clause - Nested Grouping	Executed  Executed 71-89% queries based on following:  - All single row functions  - All Aggregate functions Nested Aggregate functions - Order by - Group by - Having clause - Nested Grouping
2	Documentati				
3	on Viva	20-39% of solutions are documented properly.  Students hardly answered.	40-59% of solutions are documented properly.  Students have problems while answering.	60-79% of	

				<p>solutions are documented properly.</p> <p>Questions are answered fairly well.</p>	<p>80-100% of the solution is documented properly.</p> <p>Questions are answered completely and correctly.</p>
